Mobile App Development (Week 3: Activities & Intents)

Lesson 01

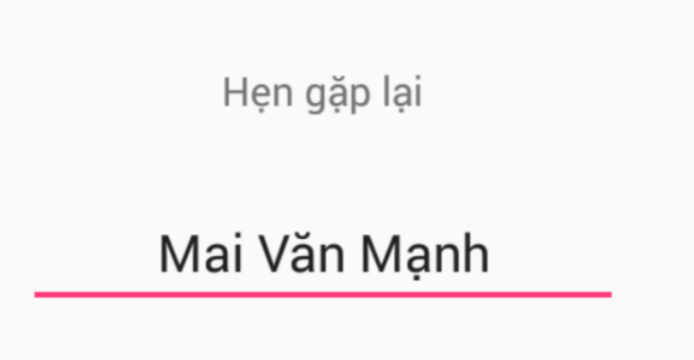

The application design is as shown below.

The application prompts the user to enter their email address. After clicking LOGIN, the application will open a new interface (Activity), which will display as follows:

The second screen displays the email entered from the first screen. Screen 2 prompts the user to enter a name. After pressing SAVE AND EXIT, the application returns to the first screen, which will then display as follows:

In there:

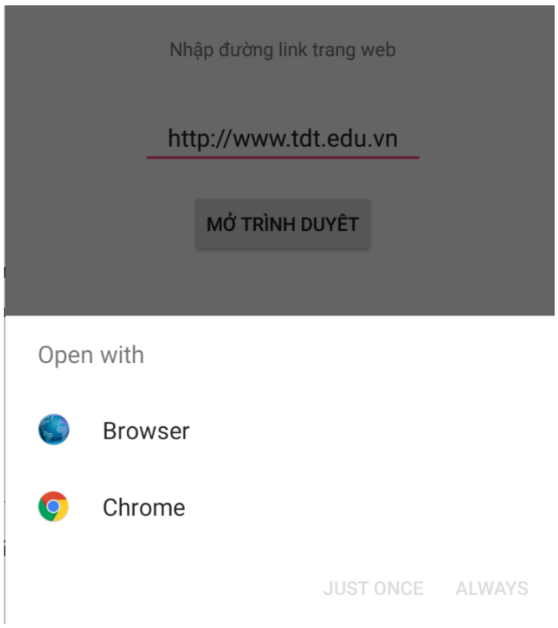

- The username is taken from screen 02.
- The LOGIN button is hidden.

Lesson 02

The application design is as shown below. When the OPEN BROWSER button is pressed, the application will call a web browser to open the webpage entered in the EditText.

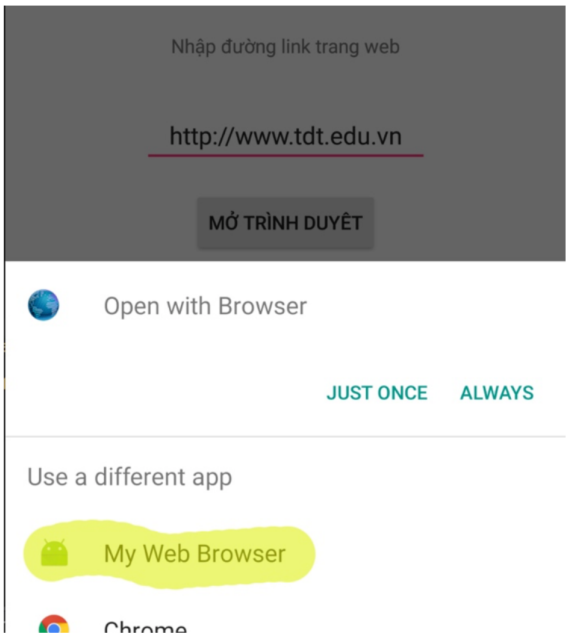

If more than one web browser is installed on your computer, the following interface will be displayed (this part is handled automatically by the operating system):

Lesson 03

In the application in lesson 2, add an Activity that functions similarly to a Web Browser, to display web pages (using WebView).

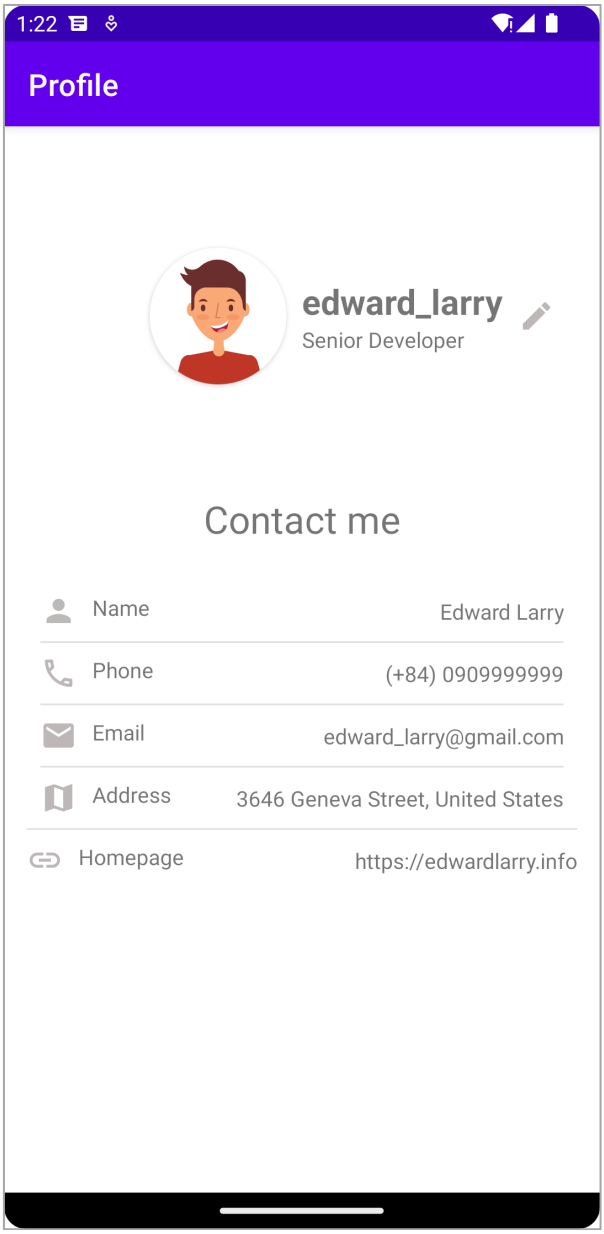

If implemented correctly, when opening any website, our application will be listed among the web browsers available for users to choose from.

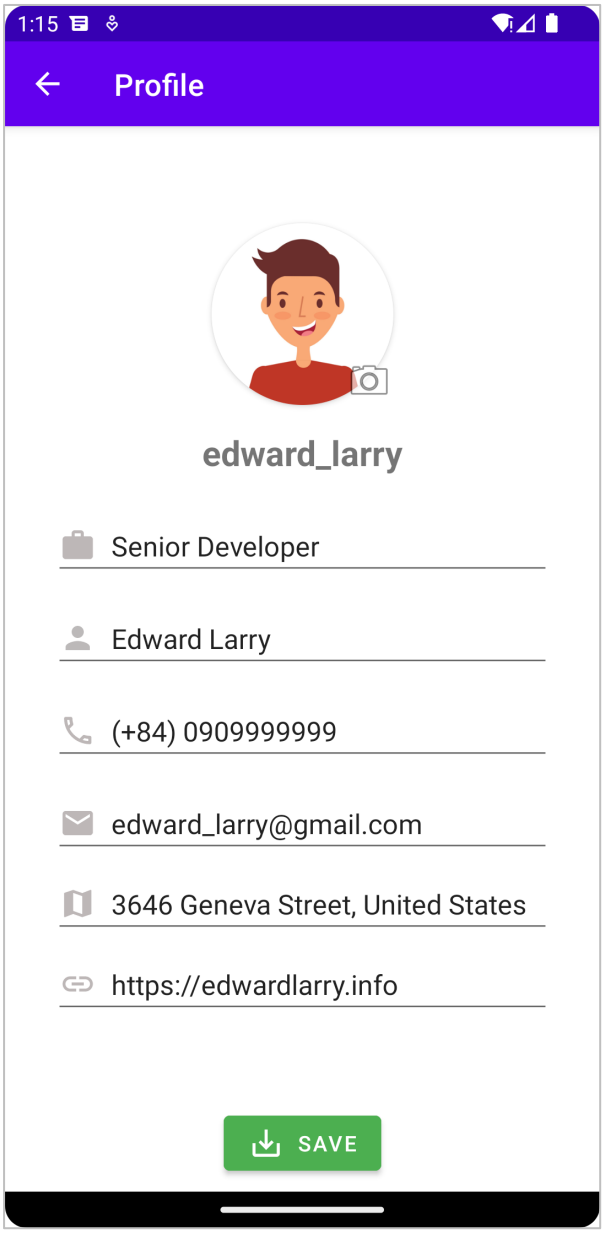

And when we click on our Browser, the application will open the Activity containing the WebView and display the specified webpage.

Lesson 04

Design the interface for the Profile and Edit Profile screens as shown below.

When the user clicks the edit icon, the application will switch to the EditProfile screen.
- The current profile information will be pre-loaded into the EditText and TextView of the EditProfile screen.

- When you press the camera button, the app will open the camera to take a picture. After the picture is taken, it will be displayed on the ImageView widget, which represents the user's avatar.

- When you press the Save button on the EditProfile screen, the application will close this screen and return to the main screen, updating/displaying the newly edited information on the main screen.
